. . all the fundamental concepts of the basic principles and methodology of musicology but also . . . deals with the modal theory of music, analysis of the modal phenomena, sound symbolism and the theory of music of non-western music like Some of the fields have been added in this third edition. These are *(a) The question of the origin of music is also taken as a crucial one by the author. *(b) Nowadays, it is well known that one of the most difficult subjects is the relation between music and emotion. The problems are as old as the written history of music. *(c) The discussions about the theory of music is so vast that the author has tried to present only a mere brief outline. *(d) Though, in this third edition, there are some advances made but as compared to the first edition the work is far from reaching the perfection. *(e) As the author is a musicologist and a composer and also the work has been kept to a reasonable size, I think the value of this book is very high. [^1]: Author's email: Turning leukocytes into cancer cells by high-level N-ras expression. Alterations of the N-ras gene have been found in a variety of human neoplasms. We have evaluated the role of N-ras in human carcinogenesis by transfection of N-ras into the human T cell leukemia cell line Jurkat. Although the Jurkat cells transfected with N-ras are growth arrested in the G1 phase of the cell cycle, they are able to acquire the properties of transformed cells: anchorage-independent growth and metastatic dissemination. Moreover, the transformed Jurkat cells show increased tumorigenicity in nude mice. N-ras-transfected cells are characterized by up-regulation of matrix metalloproteinase-2 and urokinase-type plasminogen activator, concomitant with down-regulation of tissue inhibitor of metalloproteinase-2. At variance with Jurkat transfectants, N-ras-transfected human fibroblasts did not show the acquisition of characteristics of transformed cells. Thus, the N-ras gene might represent a molecular target in
