A: First of all, 2π isn't a good choice of radius to use, because it is a circular arc. You need to find a square which is one-fourth the size of the whole thing. In other words, you want to choose a $1/4$ th of the area of π , which means you need to divide π by four. This is why you have been using $4*2\pi$. Note, though, that if you divide 2π by 4 , you get π , so you would want to test and see if it is correct before you go all the way through. Concerning the $4*$ matter, it is entirely permissible to multiply by 4 to convert to a full 4π such as you have done, except it is not necessary. That is just a matter of convenience. It doesn't change anything; you can just divide by 4 later if you like. It is in no way essential.

Pharmacokinetics and pharmacodynamics of imipramine and desipramine in the dog. The pharmacokinetics and pharmacodynamics of imipramine and desipramine were studied in the dog. The terminal half-life of imipramine and desipramine was 5-6 h. Serum half-life and total body clearance were comparable for imipramine and desipramine. The data suggest that a single oral dose of either imipramine or desipramine may be effective for a prolonged period. Serum levels of imipramine and desipramine were significantly correlated with clinical response.

Fusospora aquilega sp. nov., a new species of dematiaceous Fusosporomycetes isolated from the roots of *Aquilegia vulgaris* subsp. *vulgaris*. A new species of Fusosporomycetes, *Fusospora aquilega* sp. nov., is described from roots of *Aquilegia vulgaris* subsp. *vulgaris* collected in southern Italy. The morphology of the species is characterised by the presence of aseptate fusiform to ovoid, hyaline, and thin-walled microconidiophores, each terminating in 1-5 chains of mono- or biverticillate penicillate phialides with ba244e880a
