In the Master System version of Super Mario Bros. 3, the starter Mario 1-Up Mushroom appears to have a bonus effect: "It increases the power of the Shield". Is this true? If it is, why is my shield's resistance so close to the power of the projectile? This screenshot shows the power and resistance of my shield, the 1-Up Mushroom, and the fireballs I'm throwing. (Original resolution, you can view the full resolution in a new tab.) A: From wiki, According to a Nintendo Power article, the Super Scope has a maximum power of 1,710,000. The top speed of the Super Scope is 30 m/s. The Mario games power is determined by the original controller which was the Super Scope II. The Mario series wasn't using any other controller at that time. From the end of the article, The Super Scope was made by Nintendo and developed by Nintendo Power as the power house of Nintendo games. It was the main weapon of Mario in the Mario games. The wiki states that the original controller (Super Scope II) has a power of 1,710,000 which is equivalent to the maximum power of the Super Scope. This is why the Super Scope II has a resistance of 1,810,000 which is equal to the the maximum power of the Super Scope. From the 2nd page of the Super Scope II article, The Super Scope II can produce anywhere from 1,710,000 to 3,000,000 points of damage. From the 3rd page of the Super Scope article, The original Super Scope can produce anywhere from 1,710,000 to 1,700,000 points of damage. I hope this helps! A: Here is a screenshot of the game that you posted. From the info on that page, it appears that the power of the Super Scope is "points" or "points of damage", and the power of the other objects in the screenshot is "1 Power Unit". The power of the mushroom is 1 unit, and the resistance is equal to the power of the Mushroom. (Yes, this implies that Super Scope II has 2d92ce491b
