Is it possible to write the function _() in POSIX EBNF? If it's impossible, how about _()? A: The bash function _() is built-in. There are many special characters in EBNF, such as |, &, (and) and =~. If there are characters that bash special-cases, you can't use those. EBNF is more about describing an AST (abstract syntax tree) rather than a language. _() is rather more complicated than regular expressions because it's a built-in that doesn't use regular language constructs.
