Macro is a text file which contains predefined text to be copied to the Clipboard of your active X session, regardless of the application you are using. SOML Description: SOML is an extension to the Simple Object Access Protocol (SOAP) that defines a standard for secure communication of data between applications, the Web, and other SOML clients and servers. The purpose of SOML is to provide an easy to use

---

mechanism for web-based applications to access services by passing their security credentials. SOAP Description: SOAP is an XML-based protocol designed to be used for exchanging messages over HTTP and other networks. SOAP messages contain a header section, which consists of a number of standard tags. The standard tags are: Request Response Fault I can't believe you do not have a basic understanding of what http is. You can't use htaccess in a windows environment. The only thing you have access to is the IIS configuration. It would be easier for you to install apache and host your site on that. What you have is no secure web space at all. Use as your web address, not and your web address will be on the part of the address. In order to edit your httpd.conf file, you have to be either a system administrator or have system administrator level privileges. You need to find out the location of the IIS configuration files. You need to read the guide for IIS 7 - In order to edit your httpd.conf file, you have to be either a system administrator or have system administrator level privileges. You need to find out the location of the IIS configuration files. You need to read the guide for IIS 7 - Eliminando falhas Correcting problems You should not be wasting your time posting on vBulletin. We strongly discourage people from doing that and we don't think it's your problem. You should not be wasting your time posting on
