other automakers have
found success with
electric cars, the
Japanese are leading the
pack in an entirely
different form of
transportation. Hydrogen
fuel cell cars are starting
to gain a bigger presence
in the car market, as
more and more
automakers start looking
at the technology as a
way to decrease their
emissions and save

money on gas. But some experts say that hydrogen is just not ready for wide-scale implementation, and that some of its drawbacks could become a fatal blow to its growing popularity. Hydrogen cars have a lot of advantages over those powered by gasoline or batteries. For starters, the only emissions they produce are water vapor, and that is an environmental plus in a

time when other forms of transportation are becoming more and more environmentally destructive. At this point, they are also more convenient than their internal-combustion-engine competitors. There's no need to plug in each time you want to take a trip, and they also make for a more quiet and comfortable drive. What has a number of experts worried, however, is that the fuel cell technology

used by hydrogen cars is still under development, and that there are only a limited number of automakers and energy companies developing the technology at any one time. With the cars still in their early stages, many critics are saying that hydrogen fuel cell cars are not ready for the market as they are currently conceived. The first hurdle that hydrogen cars need to overcome is the cost of

developing the technology. When Toyota first came out with the first fuel cell car, the fuel cell only produced a small amount of power, and the price was also quite high. It took the company years to ramp up the price and make it more affordable. In fact, the first Toyota fuel cell car cost thousands of dollars more than an electric car at the time, which prevented people from

buying it. For the most part, fuel cell technology continues to be at least six times more expensive than gasoline, as well as twice as expensive as other alternative fuel options like d4474df7b8
