It can rename files with partial names without any hassle and is very lightweight. Rename Multiple Files With Regular Expressions Tiny Renamer helps you easily rename multiple files from a specified directory. This is a feather-light and portable application that supports regular expression mode along with a replace option. It can be handled with ease by any kind of users. Old and straightforward interface Although it doesn't contain particularly compelling visual elements, the interface is easy to navigate, as it shows all options provided by the utility. You can get started by selecting a folder whose file contents you want to view in the main window. There are three small columns displayed: for old and new names, as well as for their status. Tiny Renamer works in a rather peculiar way for a file renamer. It lets you type the old name of a file (full or partial), together with a new name to replace it with (full or partial). Set old and new file names After pressing the "Check" button, you can preview the new names. The status column indicates all file names selected for modifications, marking their corresponding lines with an asterisk symbol. If the strings of characters you specified match multiple file names from the list, then all those files will be modified. The renaming procedure can be executed with one click, and this task takes little time. Regex mode can be easily enabled, and the tool can be asked to ignore cases in file names. It also integrates an option for reverting changes, in order to restore the old file names, but it didn't work in our tests. Moreover, it cannot automatically refresh the directory contents, so if you want to rename files in across more than one step, you have to specify the containing folder each time. No setup required Since it's packed in a portable package, you can save the program files anywhere on the hard drive and just click the executable to launch Tiny Renamer. Another option is to keep it stored on a USB flash disk, in order to directly run it on any machine effortlessly. Plus, it shouldn't make any changes in your Windows registry. Evaluation and conclusion Although it hasn't been updated for a long time, Tiny Renamer still works on newer Windows editions. No error dialogs popped up in our tests, and it didn't hang or crash. The shark's skull, teeth and back fin remnants had been found lying flat on the bed of the Yellow River, but were not identified. This Asian shark, known to be about 4-5ft long and weighing 10-20kg, belonged to a family called Siluriformes. This includes fish like the tiger shark, the black ghost shark, the white-tip shark and silky sharks. Its first discovery was made in 2007 and was in a re-discovered vertebra from the lower spine region and its head. But the skull and teeth had not been found before. Research published in the Journal of Human Evolution shows the skull and body are very similar to another extinct relative of the shark called Felis megalodon. This shark is thought to have died out during the Eocene period 40 million years ago. According to Dr. Ailun Zang of the Institute of Vertebrate Paleontology and Paleoanthropology, the shark has lived in China since then and was once a 09e8f5149f

The differentiation effects of all-trans-retinoic acid (ATRA) on the growth and differentiation of acute promyelocytic leukemia (APL) cells were investigated. ATRA or dimethyl sulfoxide (DMSO) was added to the cultures of NB4 cells at the concentrations of 1 microM or 0.1%. The effects of ATRA were demonstrated by a reduction of the proliferative activity, induction of monocytic differentiation, induction of maturation of the cells to granulocytes and reduction of surface antigens. The effect of ATRA could be demonstrated in a dose-dependent manner and the maximal effect was observed in the cultures treated with 0.1% ATRA. The maximal effect of ATRA on granulocytic differentiation was also demonstrated by morphological analysis, and the percentages of CD11b-positive cells were 14% and 75% by conventional cytology and by CD11b immunofluorescent analysis respectively, in the culture treated with 0.1% ATRA. ATRA had no effect on the proliferative activity of NB4 cells until day 6 of incubation, but it significantly reduced the proliferative activity on day 9 of incubation, which is not required for the differentiation. In addition, ATRA reduced the expression of CD15, a granulocytic marker, and increased the expression of CD11b, a monocytic marker. These results indicate that ATRA induces the differentiation of APL cells, mainly the monocytic differentiation, and is not toxic to the cells at the concentrations of 1 microM or 0.1%.The shipping industry is going through a major transformation, thanks to automation.
