Batch edit The ObjectARX design pattern allows multiple objects to be created in the same fashion as regular objects, but with additional functionality. These objects are then saved together into a temporary project, where all objects are "batched" together and saved as a single unit. This allows for a high number of objects to be edited or modified at once. Some examples of such ObjectARX applications are, but not limited to: Autodesk BIM 360 Architecture In BIM 360 Architecture (formerly AutoCAD

Crack For Windows Architecture) architects, building information modeling, and builders have access to built-in visualization, collaboration, and workflow tools as well as efficient workflows for 3D modeling and 2D drafting. BIM 360 Architecture is also used as a set of building information modeling templates, which is a very useful feature. Inventor An application used to support the free-form 3D CAD design and drafting technology of Inventor. Inventor uses direct manipulation to quickly generate a variety of 3D shapes and components. It enables users to create projects, documents, and mechanical assemblies that consist of models, drawings, and text descriptions. Unlike most CAD applications, Inventor's user interface does not require a mouse or other input device. It is designed for use with a stylus and finger. When using the "pen" tool, Inventor creates lines, arcs, surfaces, solids, and fillets. Inventor's "brush" tool is analogous to a selection tool and is used to interact with solids, assemblies, and components, as well as to create drawing boundaries for walls and doors. Finally, the "model" tool is used to create freeform solids.
