The development's height was initially expected to be 11 storeys and the penthouse will be the highest residential unit in New Zealand. The building will feature 118 apartments in mixed residential and commercial use. It will also include function spaces, such as a rooftop barbecue area, a cafe, gym, spa and pool. The development is adjacent to Auckland's Parnell retail and leisure precinct, Auckland Central rail station, and the city's main hospital and schools. Partners in the development include property developer Iconic, retail property investors Richard Gill Property, and aJSA Infrastructure.Q: Call methods of a super class within a subclass in java I'm learning java. I'm making something with jdialog, and I have this code: public class Dialog extends javax.swing.JDialog { public Dialog(java.awt.Frame parent) { super(parent); initComponents(); } It's ok. But my problem is that I need to make a callback for one method that lives in the super class, but it is not possible. I have to do somethings with the screen before the user press "OK". I've tried this: public Dialog(java.awt.Frame parent) { super(parent); initComponents(); someMethod(); someMethod2(); } But didn't work. It makes an infinite loop when I press "ok". I've tried making two class and inher

Spyware-Free vray for sketchup full version First time to download v-ray for sketchup pro. Download v-ray for sketchup pro for free from our site. Free Download V-Ray Pro for SketchUp from this site. Q: Why Is my Python/NumPy script staying in an infinite loop? This is my first time posting a question, so I apologize if I'm doing something wrong. I've used Python/NumPy for the first time today, and I'm having trouble figuring out why my program is looping infinitely. My program is supposed to read an input file, and for each line in the file, do the following: Take the first column (x\_coordinate) of the line, and use this to determine the x\_coordinate of an image file. Read the third column (y\_coordinate) of the line, and then use this to determine the y\_coordinate of an image file. Read the second column (intensity) of the line, and then use this to determine the intensity of the image file. Use the detected image to compose a new image, which is then saved as the output image. Here is my code: import numpy as np def loop\_array(line): x\_coord = line[0] y\_coord = line[2] intensity = line[1] image = np.zeros((y\_coord, x\_coord, intensity), dtype=np.uint8) # Determine the x and y coordinates of the image file. file\_x = int(x\_coord) - int(x\_coord\_image) file\_y = int(y\_coord) - int(y\_coord\_image) for x\_coord\_image in x\_coord: for y\_coord\_image in y\_coord: # Read the intensity of the image file. with open(image\_file + x\_coord\_image) as image\_file: line\_iter = line.split() for i in range(1, len(line\_iter)):
