RESTful API. AutoCAD Product Key provides a rich API for automation and integration with other applications. The cationic helix-turn-helix DNA binding protein from human immunodeficiency virus type 1, HIV-1 Tat, has a very important role in HIV-1 transcription. Tat forms a unique sequence-specific DNA binding protein complex. We have studied the binding of Tat-21 amino acids peptide to DNA in aqueous solution. The equilibrium and kinetic binding studies were performed by means of absorption and fluorescence spectroscopy. It was found that this peptide forms a 1:1 molecular complex with the d(CACGTGA)₂ oligonucleotide. The binding parameters were derived from the titration experiments and were determined as K_a approximately 1.29×10^7 M⁻¹, ΔH approximately -6800 kJ mol⁻¹
