MongoDB is the No. 1 database software in the world Introducing mongoDB 3.0 The first fully open-source and free version of MongoDB MongoDB is an open-source database software that makes it easier to create applications that run on a variety of operating systems. You can use MongoDB to build apps for web, mobile, or server in one database with zero-configuration, using the Ruby programming language. MongoDB 3.0 comes with a simpler and more powerful software architecture that offers faster database operations, supports enterprise-grade transactions and replication, and comes with more security features than its predecessor. MongoDB server is a database server in which data storage and query processing are performed using JSON documents and MongoDB wire protocol. MongoDB server uses the scalable storage model based on the hierarchical design for document storage, and so, it can hold very large data sets without any problems. As for the query processing, MongoDB server is based on an event-based system, and it can accept thousands of operations per second and can execute them efficiently. Thus, MongoDB server has attracted a lot of interest from the world's leading software companies. I come back to a lot of data. I try to be the parent of my kids.
