author's website. In order to use the program, you can choose to download it or buy the full version with a 60-day trial. There are no other ways. Furthermore, the process of using it is really simple, so we found the software incredibly easy to use, even for people who are not aware of its functions. One of the features of this program is the ability to compare multiple files and directories for all sorts of differences. The list of

---

operations it supports is really large and has been expanded over the past several years. So, you can find a lot of solutions to different file problems. For example, you can use it to create a detailed file of how many files are located in one folder, files that don't match the extension or which files are larger than others. Another interesting feature that this software has is the ability to find duplicate files. You can easily exclude unneeded files or add

---

them to a list. Furthermore, it is possible to group them by files, folders, or even by specific extensions. The newest version of the software also lets you search for the newest versions of files, with different options. So, you can set your preferences for the search order. For example, you can specify whether you want to search all kinds of files, only archive files, only text files, only word files, only MP3 files, etc. The

---

tool can automatically update the program database. This is a really good feature, because you won't need to spend hours finding a new extension of a file, or if you're trying to remove all viruses from your disk. Many people are getting increasingly worried about the security of their computers. The threats are many and the owners just don't have time to remove them. So, you can use a tool like D-FileMU, which can catch as

But you can also clear the original file name, delete the last given characters, replace text, add text to the beginning or the end of the file name, as well as add numbers in sequence to the beginning or end. Furthermore, you can add or remove

read-only, hidden or archive attributes from the files, change the file extension, capitalize words and completely rename the file names. In the next step, you can select the method for the aforementioned actions (by choosing files individually, by file extension or both). Now you can use a treeview to locate and add files to the processing list (the "drag and drop" method is not supported). If the file name is not

unique, you can set D-FileMU to overwrite it, add a unique number or do nothing. But you can also preview the changes and set the tool to automatically generate a process file, before applying changes. The program uses a very low amount of system resources and didn't freeze or crash when we tested it. It doesn't have a help file (not as if it needs one, since it is extremely easy to use) and the format of the window doesn't

The interface definitely needs some improvements. Additional file and file name functions as welcomed as well. We recommend D-FileMU to all users.

Q: Apply function to list subset

I have a list called LST

$LST = Table[\{i, i\}]$  and I would like to apply a function  $f$  to each element of the list LST that corresponds to the smallest value of  $i$  for this list, but with a "key" function that uses the

---

value of LST[[i]]. I have tried f[LST]  
= {#[[1]], #[[2]]} & /@ LST which  
gives {f[Table[ 09e8f5149f
