This guide includes instructions to automatically partition, format, and protect your hard drive in AutoCAD. If you are a CAD artist or engineer, you can benefit from having a stable, fast, reliable hard drive that holds a vast amount of data that will last a lifetime. It is recommended that you have two or more partitions, each holding a different type of data. Contents: Step-by-Step instructions: Step-by-step instructions: "A Hard Drive for a Hard Drive" AutoCAD Tutorials - If you are using a smaller laptop, your best option is to create a separate hard drive partition for AutoCAD. This will give you the best performance and easiest backup options. The most common sizes of hard drive are 3.5" and 5.25". If you can, use a hard drive designed for laptops or desktops rather than a standard desktop hard drive, because some are better than others at withstanding the mechanical shocks of a laptop. If you plan to backup or archive your data, you should think about purchasing at least a 3.5" hard drive for AutoCAD. A smaller size of hard drive will work for AutoCAD. If you are using a standard desktop hard drive, then you should choose the largest available hard drive you can afford for your needs. This will give you more total space, and it also means you will be able to replace the drive without having to perform the maximum number of steps to do a Hard Drive Installation. Hard Drive Installation Steps - Set your system clock to the correct time, then begin by verifying that your system BIOS is not set to Fast Boot mode (Fast boot is used to speed up the boot process of the computer, but it also uses some advanced features that are not always supported by all computers). Your system BIOS is normally located in the CMOS setup screen. The following steps will move you through the installation process, which may involve unplugging and reconnecting your hard drive to the computer. Remove the lid of your computer case. The picture to the right shows a standard 3.5" hard drive with a hard drive cover. Make sure you have a set of proper hardware removal tools (pliers, screwdriver, etc). Remove the power connector from the drive. Unplug the power connector. Remove the hard drive and set aside. Set aside a pair
