Architectural applications AutoCAD Architecture AutoCAD Architecture is a vector-based drafting software for architects, engineers, and interior designers. The application is available in two versions, Architectural and Architectural Mobile (later renamed Architectural Mobile Pro) – the former for desktop use and the latter being a version for use with handheld devices. The earlier version is known as AutoCAD Architecture. The current version is AutoCAD Architecture 2017. It is available for purchase from Autodesk via an application store or as a cloud download. In addition, AutoCAD Architecture is available as a subscription-based service through Autodesk Vault (previously named Autodesk AppSource). The application does not require a license for the software itself and is free to use for the first 30 days after a user downloads it from either Autodesk's application store or Autodesk Vault. AutoCAD Architecture runs on Microsoft Windows, macOS, iOS and Android devices. Compatible with the ANSI Z-10 CAD format specification. Similar to a SketchUp model, the user can save and load Architectural models via the cloud and have access to them on both iOS and Android devices. AutoCAD Architecture offers a variety of features, including: Viewing and editing of 2D and 3D floor plans and room layout plans Assign rooms to specific users Export models to various CAD and 3D formats Export to PDF Partition and print generation Export to DWG, DXF and other formats Cut-up blocks Object Management, including the ability to create and edit objects from a library Digital elevation models Site and area measurements Site, area and area measurements OneDrive documents can be viewed, created and exported to a wide range of formats, including PDF, DWG and DXF. I'm trying to convert from a text file to a pandas data frame. I have several columns of data, all strings. The values of the columns are all separated by commas, and I'm using pandas to read each row into a data frame column. I know that a typical way to remove data from a column would be `df.drop(index=column_number)`, but for the sake of argument, I'd like to know how to remove data from a column, without the need to write to disk and read back in. I'd also like to know why this doesn't work: `df.ix[:,1] = df.ix[:,1].replace(',', '')` A: Use `str.strip()`: `df.ix[:, 1] = df.ix[:, 1].str.strip(',')` Q: Why is my query returning empty objects? I'm trying to make a query that retrieves a collection of 'meetings' in a Backbone.Model. My problem is that I'm getting all of my objects, but when I `console.log(meetings)`, I get an empty object. I've been thinking about this for hours, and if I'm not mistaken, it has something to do with my chaining, but I can't figure it out. My model is in a module, and I want to be able to get the collection of all the meetings. Here is my code: `Meetings.js define([ 'jquery', 'underscore', 'backbone', 'collections/Meetings', 'views/MeetingsView' ], function($, _, Backbone, MeetingsCollection, MeetingsView) { var Meetings = Backbone.Model.extend({ urlRoot: 'Meetings.html', initialize: function() { } }); return Meetings; }); MeetingsCollection.js define([ 'jquery', 'underscore', 'backbone`
