No one was killed, but as a result of the breakdown, one of the vehicle's tires burst and the truck rolled down the steep mountain road. As it went down, it smashed into a large wall, demolishing the truck and spilling water all over the roadway. The video, which is in French, shows the cascading water flooding the roadway and covering all the lanes.The present invention relates to a television receiver apparatus capable of receiving in a picture-in-picture (PIP) mode, and a method for controlling such a television receiver apparatus. In the field of television receiver apparatuses, so-called PIP apparatuses, in which a video signal can be output to two channels simultaneously, have been developed for the purpose of saving the amount of time and labor which is needed to set up the channel setting. The PIP is available to double the amount of television programs that can be viewed. When, for example, a program from Channel A is being watched in Channel B, the program on Channel B can be shown in Channel A. The PIP apparatus has a display in which video signals of the different channels are both displayed. However, due to the technical difficulties associated with displaying two video signals on one display screen, the results in which the image quality is reduced, the picture size is reduced, and the resultant display is unsuitable for certain types of viewing, are apparent. In the past, when watching television programs through a PIP apparatus, the user was required to view two different channels using a single display and adjust the volume levels so that the picture quality was neither extremely degraded nor too much of a problem. For example, as shown in FIG. 18, by adjusting the volume so that the picture quality is not so great or the program is not so loud that the volume must be reduced when viewing other channels, the user is capable of watching the same program in two different channels. However, in this conventional method, as shown
