- Blending mode:** Blending modes are used to show the results of blending the underlying layer with a new layer. For example, using the Multiply blending mode, you can create a grunge effect.
- Difference blending mode:** This mode creates darkening, halos, or other blurring effects when you use the Difference blending mode. You apply the mode by choosing it from the Blending drop-down menu in the Layers panel when you create a new layer or modify an existing layer.
- Exclusion blending mode:** You can use this mode to reduce color and ink levels, or both. In Figure 1-1, Photoshop applies a large black area to the sky to indicate clouds in the photo. Notice how you can turn off the area completely. You can also use the Pen tool (see the upcoming section "Using the Pen") to add text directly to layers or the Background layer.
- Darken:** Select the Darken option on the Blending menu to create a darker image. You can also use this mode to paint darker areas on your image.
- Multiply:** The default mode for blending is Normal, which produces a medium-intensity version of the image. To create a stronger image

Perinatal ocular trauma in India. Vision screening of newborns is of prime importance for early identification of treatable conditions such as retinopathy of prematurity (ROP). However, screening for ocular trauma may not be done due to lack of awareness among health care professionals. To assess the prevalence of perinatal ocular trauma in newborns and to determine the spectrum of ocular trauma among these infants. This cross-sectional study was conducted at the department of ophthalmology in a tertiary care hospital in Jaipur during the period from September 2009 to October 2010. The newborns were examined in the first month of life for conjunctival congestion, corneal abrasion, limbal dermoid, and retinal haemorrhages. Conjunctival congestion was graded on the basis of a score of 1 for redness with clear margins, 2 for marked congestion with inflammation, and 3 for gross oedema. The prevalence of perinatal ocular trauma in newborns of the hospital was estimated as 22/1000 births. Conjunctival congestion, limbal dermoid, corneal abrasion, and retinal haemorrhages were seen in 8.1, 4.2, 6.2, and 0.6 of 1000 newborns, respectively. Perinatal ocular trauma was found to be more common in male newborns compared to female (n = 10 vs. n = 2). Perinatal ocular trauma was found to be more common in the first week of life and showed a declining trend with increase in age. The prevalence of ocular trauma was high among the newborns in this study. Conjunctival congestion and corneal abrasions were the most common ocular trauma observed. Ocular trauma was found to be more common in male newborns. This disclosure relates generally to information processing systems and, more particularly, to information processing systems and techniques for use in storing, sharing and receiving information. As computing technology has advanced, so have the ways in which users of information technology systems, or users of mobile devices can access the systems and the information they contain. This is especially true in cases where the access may provide a difficult or cumbersome task. For example, accessing or opening a file in a typical computer operating system generally requires access to the operating system's user interface and may require the file to be located in a particular location. One approach to accessing information, such as a file, involves use

Q: Method to create a new collection of objects I have this Class SampleClass public class SampleClass { private int year; private String name; public void setYear(int year) { this.year = year; } public int getYear() { return this.year; } public void setName(String name) { this.name = name; } public String getName() { return this.name; } } I have a collection of SampleClass like this SampleClass[] sampleClass = new SampleClass[10]; I need to create a new collection of SampleClass Example of need to sampleClass : sampleClass[0] = {2019, Michael} sampleClass[1] = {2018, Hannah} sampleClass[2] = {2017, Jack} sampleClass[3] = {2016, Carl} sampleClass[4] = {2015, Lisa} sampleClass[5] = {2014, Jenny} sampleClass[6] = {2013, Mark} sampleClass[7] = {2012, John} sampleClass[8] = {2011, David} sampleClass[9] = {2010, Eric} the number of sampleClass are random in number Thank you in advance A: If you know that you will never have more than 10 you can do this. If you need something that can grow bigger then you will need to use an ArrayList. In this case, sampleClass would be an ArrayList. import java.util.ArrayList; import java.util.List; public class SampleClass { private int year; private String name; public void setYear(int year) { this.year = year; } public int getYear() { return this.year; } public void setName(String name
