Although the _Photoshop_ screen looks a bit complicated at first, it's really organized into sections of similar tasks. The four Photoshop windows can be docked to each other to open in a single window (or split into three). This way, you can see everything you've got open at one time. After you're happy with the image you've created in Photoshop, you can save it in a number of different formats, depending on the nature of the file. This chapter introduces you to the most popular file types and gives you some tips for perfecting your image so that you can save it optimally for use in the other applications that use these image file types. If you're new to the world of digital images and graphics, don't be afraid to make the transition. You can create your artwork in various other graphics applications, such as Adobe Illustrator, CorelDRAW, Freehand, Indesign, QuarkXpress, and Xara Web Designer, to name just a few. You can explore the interface and features of the programs later in this chapter. I provide information on these other programs as well, in case you decide to take advantage of them. # SWITCHING TO A TRADITIONAL WINDOWS-BASED WORKFLOW In the past few years, the number of graphics applications for Windows has increased dramatically. Depending on which of those applications you want to use, different tips and techniques are available. However, from an editing standpoint, most of the time you find yourself working in one of the applications that have been bundled with Adobe Photoshop. You can work with other applications while you're working in Photoshop, of course. You could open an image or two in Microsoft Word and work on an article. But until you become expert at a certain program, you can expect to rely on Photoshop for the majority of your image editing work. In case you weren't aware, Photoshop is still a Windows-only product. That means that you can use only Windows computers to open, save, and manipulate your images. (Okay, you can also do it on a Mac, but I'll let you know how.) There are several reasons for this: * Photoshop has a lot of high-end functionality and it takes a lot of hard drive space. * Photoshop is based on a tile-based system (as you read about in the next chapter), and Windows computers don't use tiles efficiently. * Photoshop

$\mathcal{L}^2(G)^n$, where \tilde{f}_k is the left-inverse of f and f^\dagger . Then $\tilde{f}_k \circ \mathcal{L}^2(G)^n \rightarrow \mathcal{L}^2(G)^n = 2^{-1} \tilde{f}_k \circ \mathcal{L}^2(G)^n \rightarrow \mathcal{L}^2(G)^n$. Hence, $\tilde{f}_k \circ \mathcal{L}^2(G)^n \rightarrow \mathcal{L}^2(G)^n = 2 \tilde{f}_k \circ \mathcal{L}^2(G)^n \rightarrow \mathcal{L}^2(G)^n$. Let $f \in \mathcal{L}^2(G)$. Then \mathcal{J}_f is the identity on $\mathcal{L}^2(G)^n$ if and only if $\mathcal{J}_{\bar{f}}$ is the identity on $\mathcal{L}^2(G)^n$. By Theorem [T:dual], the adjoint operator of \mathcal{J}_f is $\mathcal{J}_{\bar{f}}$. But \mathcal{J}_f is the identity if and only if $\mathcal{J}_{\bar{f}}$

Q: What is a more idiomatic way to write this function in clojure (defn is-passed [f a] (f a)) (is-passed + 2 5) ;;=> (number? 2) (is-passed println 3) ;;=> (empty? 3) (is-passed {} 3) ;;=> (map? 3) This is my current solution to the question "Given a function that takes two arguments, how do I write a function that test if any one of those arguments is nil?" What is a more idiomatic way to do this (if possible)? A: One possibility is to use map: (defn is-passed [f a] (or (f a) (map? a))) A: As @jthill suggested in his answer, another way to write it is: (defn is-passed [f a] (or (f a) (map? a))) However, like Joost suggested in his comment, you should generally not use/set the variable name f. It's conventional to write the name of your argument variables as the first part of the name, like so: (defn is-passed [f v a] (or (f v) (map? a)))
