following operations: it, .The U.S. Military Is Building an Air Force The Air Force should be a huge strategic equalizer and the U.S. military's bedrock should be the command and control systems that operate aircraft, drones and other assets. Think of the military as a giant T-shirt factory. The big manual labor machine should be the aircraft, and the strategic brain the computerized controls. Then the factory has to manage production, resources, logistics and a strategic leadership that coordinates all of the military assets. Because it is a factory, the Pentagon should be centrally managed, and it should be in one of the three major U.S. cities, Washington, D.C. or San Francisco (the gateway to the Pacific). The factory is a great model for the military. The production lines and the workers in it are production lines (aircraft and ground vehicles) and industrial workers, the machinery is the aircraft, the management is the command, control and cyber systems. So, as production ramps up, like with a garment factory, resources should come from outside the U.S. The largest military commitments of the U.S. are to the Pacific, the only one that matters. Japan and South Korea are older, and it is their leadership that Washington needs to negotiate and finance. I have said that the crisis of leadership
