Taginator will automatically read and write Mp3 tags for your music, as long as the music format is one of the supported Mp3 file formats. After writing tags, taginator will write an.xpt file (Mp3 Tag) with your tags to a specified location (default = your personal directory). Taginator uses WIA and WMP libraries to read a file name and extract the required information such as album, artist, and title into Mp3 Tag format. A new feature called Take Cover lets you specify a location where Taginator can write the tag information to. This way you can have a unique tag for all your files even if the file names are not the same, you can have only one song with different artists and album covers, and so on.
