Diablo 2 Play Disk VCD Mod ((HOT))

the process, in order of invocation, is: cd to the area where you want to write the files. run gunzip on the diablo2-playdisk.vcd image. run a gunzip on the diablo2-playdisk.iso image. run v2fstune. run mkisofs. run mount -o async /tmp/diablo2-playdisk.vcd /mnt/. run tar xzf diablo2-playdisk-updates.tar. run mv diablo2-playdisk-updates.tar diablo2-playdisk-updates.iso. burn the image with an appropriate burning program. note, the initialization and image writing operations can be combined by a single tar command. however, after the image has been written and the process is terminated, there is no way to resume the interrupted write. ufs does not allow the creation of symbolic links as it is impossible to update the inode table from which the inode numbers are derived. however, it is possible to work around this restriction by using mount options to make an entry in the file system look like a symbolic link. this makes ufs really equivalent to a vfat file system. for the most part, the process is simple. after the first two steps, everything is exactly the same as creating an iso image. however, there are a few differences. the first difference is that, before making the changes, the directory /tmp/diablo2-playdisk.vcd is unmounted and the file system is remounted read/write. as a result, all non-write operations on the file system cause an error. when the file system is remounted read/write, the next step of the writing process is aborted. you can unmount and remount at any time, but doing so causes the file system to be remounted read-only.

Diablo 2 Play Disk VCD Mod

sudo vi /etc/x11/xorg.conf section "serverlayout" screen 0 "primary" inputdevice "ps/2 generic mouse" "corepointer" inputdevice "keyboard0" "corekeyboard" option "corepointer" "auto_dev" option "corekeyboard" "auto_dev" subsection "display" depth 1 endsubsection endsection diablo 2 play disk vcd mod note the addition of the auto_dev option to option "corepointer" and option "corekeyboard" directives. this directive means that if no other touchpads or keyboards are detected, xorg will try to probe for one (as both corepointer and corekeyboard are now only "auto_dev", this would no longer make sense). the directive indicates that this device should be set to "auto_dev" in section "serverlayout." the advantage of the new asynchronous write implementation is that meta-data updates are much more responsive. we see this in the number of directory deltas, which increase as more frequently accessed files are updated. meta-data changes are probably the biggest issue related to responding to disk changes. there is no reliable mechanism to tell when a file was created, or when a file's contents have been updated. unless the file changed size, updating the meta-data to reflect the file's new size may be impractical, as this may involve a number of disk changes and even an entire write operation. for example, consider a file system that contains only the meta-data for a single 8kib file. if the file's contents were updated, the meta-data would not have to be updated to reflect the new file size; the file contents would suffice. 5ec8ef588b
